

Measuring Systems for X-type Conveyors*

XRA Manual Measure with Digital Readout

The XRA Manual Measure is provided with a digital readout of set cutting length. The sliding carriage is clamped securely in place with a lever. The measuring head pivots to allow passage of the material along the conveyor as required.

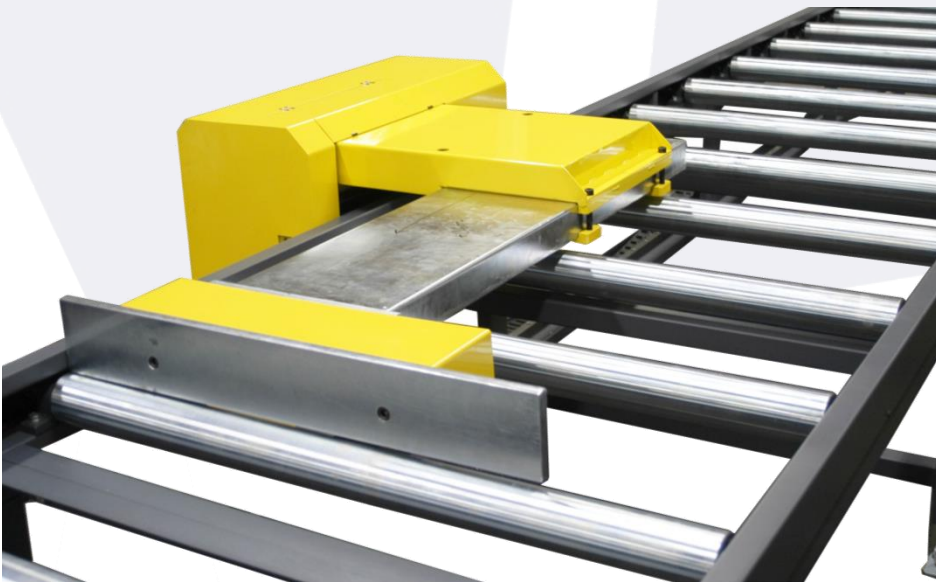

*Conveyors are sold separately

XNCA Powered Measuring Stop

The XNCA consists of a powered measuring carriage that moves to a pre-programmed position. A digital readout of the programmed cutting length is provided on the separate control console. Up to 100 different length measurements can be programmed into the control unit.

The head automatically clamps in place to prevent movement when the material is pushed into the stop. The measuring head also pivots to allow passage of the material along the conveyor as required.

Configuration

All Prosaw measuring systems can be configured as either left-hand or right-hand (as shown below). Please specify required direction at time of order.
